

Workshop on soil development connected to human impact

This workshop will deal with different development types of topsoil/soil surfaces in a forest environment after severe human impact such as clearing, burning and cultivation.

As a comparison and contrast soil samples from the development lines on mining spoils will be presented and discussed.

The workshop will be based on original soil samples and thin sections. You are also invited to bring own material.

The workshop will take place at 11th of July, 14.00 to 18.00. Early arrived participants may already look to the material from 10.00 on.

The material will be exposed during the symposium in order to allow a longer discussion.

Erhard Schulz.
